## Agenda

- PowerBI Overview
- PowerBI Components
- How to get data
- Dashboard Examples:
  - FirstRespondersKit Monitoring Dashboard
  - Xevents Dashboard
  - Job Information Dashboard
  - Permission Information Dashboard
  - Streaming DataSet

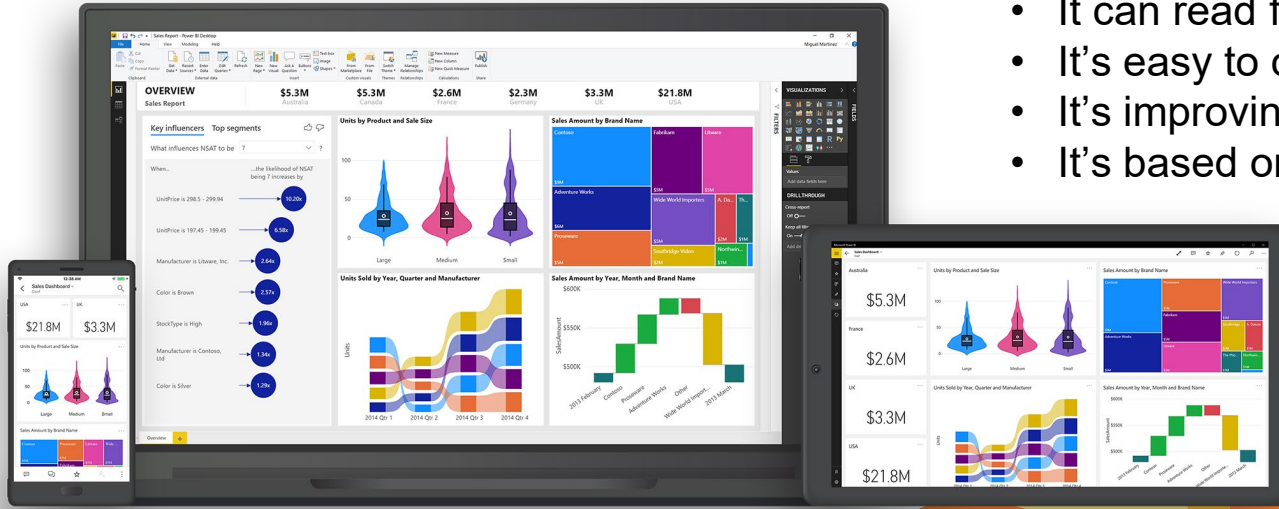

# **PowerBI Overview**

# “Power BI is a business analytics service that delivers insights to enable fast, informed decisions.”

We use it as an (improper) monitoring tool because:

- It's free\*
- It's on the cloud
- It can read from a lot of data sources
- It's easy to create graphs and get insights
- It's improving month by month
- It's based on SSAS Tabular

# PowerBI is **NOT** a monitoring tool

PowerBI is not built to be a **monitoring** tool but a reporting tool

A proper monitoring tool is tailored on the specific environment to monitor, it already knows where to find the data.

PowerBI is a generic reporting tool that allows you to analyze the data that you provide, coming from anywhere, in order to monitor and visualize it through a report.

There are some limitations that you will learn to hate:

- Relations between tables don't work the way you expect them to
- Time granularity is way too coarse for certain indicators
- Some trivial operations in SQL are really complex to implement
- Etc..

# PowerBI IS useful for monitoring

- It allows to share performance and health information internally or to third parties without granting access to anything but the report
- It allows to give insights to Devs about performance, errors, permissions, etc. without having to teach them how to or having them ask you all the time
- It allows to create a centralized view for all the systems to be monitored, as opposed to checking each environment on its own
- It allows to create reports templates to distribute within the company (or the community!)

# PowerBI IS useful for monitoring

Depending on how you're going to use it, you can get away without paying any license:

- PowerBI Desktop (i.e. creating and viewing reports on your PC) is 100% free
- Uploading reports to the PowerBI Cloud in your personal workspace is free
- Embedding & Publishing to web is free
- Manual and Automatic dataset refreshes are free
  - Both from Cloud and On-premise sources via a gateway
  - The gateway can be installed as a service on a dedicated machine for all users or installed on your machine in "personal mode"

# PowerBI IS useful for monitoring

So how does Microsoft makes money over PowerBI if everything is basically free?

With the Enterprise features, of course!

Do you need them? It depends.  
Do you need them to go out and try immediately what we're going to see? Nope.

<https://powerbi.microsoft.com/en-us/pricing/>

## Per-user license type comparison

Here is a list of features supported by per-user license type.

	Free	Pro
<b>Connect to 70+ data sources</b>	✓	✓
<b>Publish to Web</b>	✓	✓
<b>Export to PowerPoint, Excel, CSV</b>	✓	✓
<b>Enterprise distribution</b>		
Apps	×	✓
Email subscriptions	×	✓
Embed APIs and controls	×	✓
<b>Collaboration</b>		
Peer-to-peer sharing	×	✓
App workspaces	×	✓
Analyze in Excel, analyze in Power BI Desktop	×	✓

# PowerBI IS useful for monitoring

At this point I'm already hearing you saying:

*"Ok, but why should I use it as opposed as any other free monitoring tool?"*

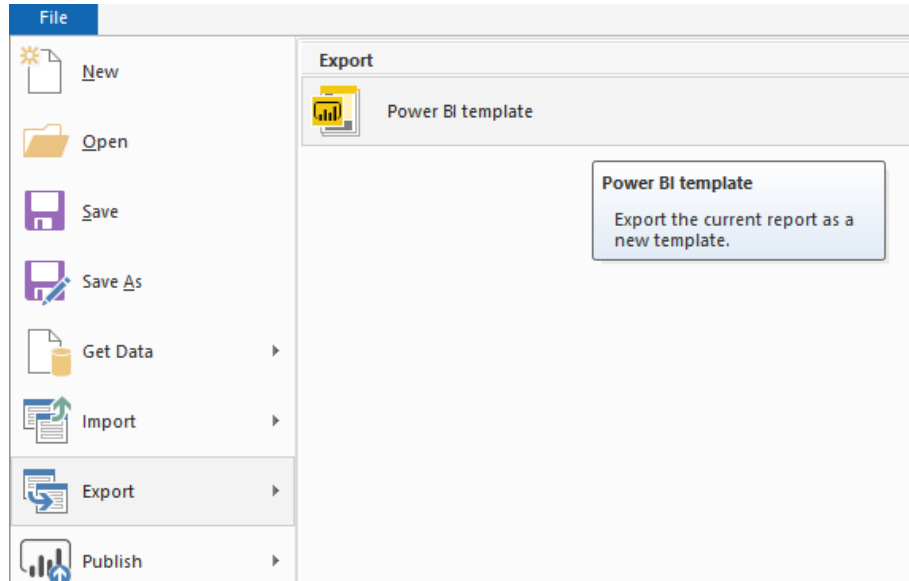

If you can install any proper monitoring tool for your purpose, great, go for it!

But:

- When you want to quickly visualize some kind of information
- When you cannot modify **anything** in the system
- When you cannot install any third party software
- When for third party software you cannot configure proper security rules
- When you need to monitor something that has no tools available
- When you need to monitor custom processes
- When you need an overview of multiple independent systems

This approach is for you!

# PowerBI is useful for monitoring

Report Templates can be created (\*.pbit)

They contain all the modelling info, but none of the data/connections

You can open a template, enter your connection details and you're ready to go

# **PowerBI Components**

# PowerBI Glossary

- **Report:** The pbix file you're working on
- **Report Page:** Each page of the report (can be hidden or visible)
- **Visual:** Each graphical element in a report page
- **Workspace:** A container for dashboards, reports and datasets
- **Dashboard:** Visuals from different reports can be displayed in a single place, called dashboard.
- **App:** The contents of a workspace can be (selectively) bundled in an app that can be distributed

A report can contain multiple pages, each pages containing multiple visuals (table, graphs, etc...)

Dashboards are online elements of a workspace that can contain visuals from any of the reports in the workspace

PowerBI Desktop is the Windows tool to build reports

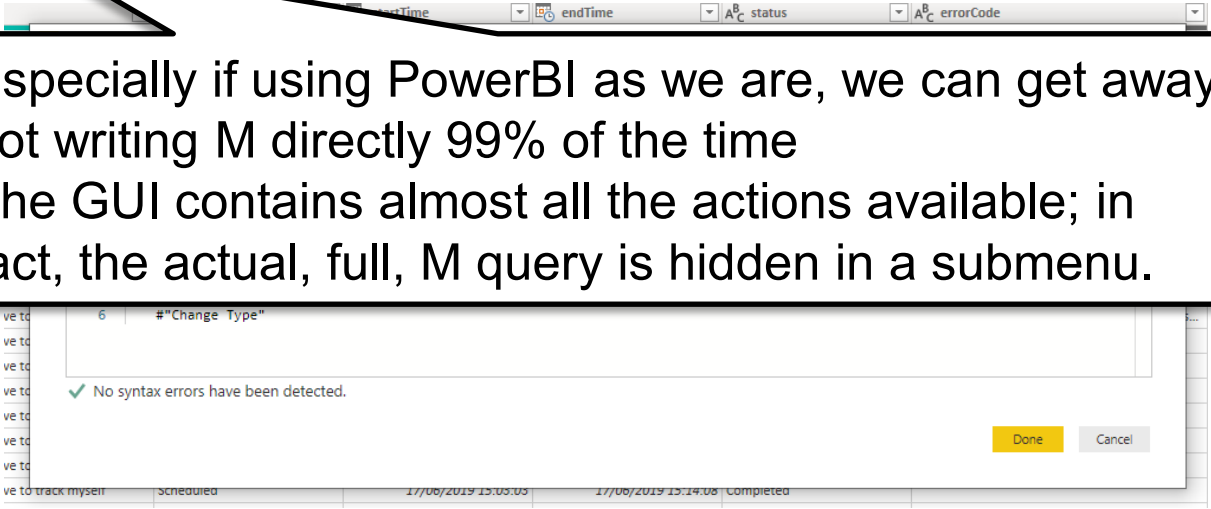

A Dataset is basically a SSAS Tabular model where the imported data is loaded

Databases, files, online services, etc... are called Data Sources

# The PowerBI Language(s)

## M (aka Power Query Formula Language)

A screenshot of the PowerBI M query editor. At the top, there are several dropdown menus: 'endTime', 'A<sup>B</sup><sub>C</sub> status', and 'A<sup>B</sup><sub>C</sub> errorCode'. Below these, a text box contains the message 'No syntax errors have been detected.' with a green checkmark icon. At the bottom right of the text box are 'Done' and 'Cancel' buttons. The background shows a table with columns and rows, including a 'Scheduled' column and a 'Completed' column.

Especially if using PowerBI as we are, we can get away not writing M directly 99% of the time  
The GUI contains almost all the actions available; in fact, the actual, full, M query is hidden in a submenu.

- Kind of an ETL Language, it gets you from the source data to the model Table
- If you're an Excel Power user, you probably already know (or at least use unknowingly) M

# The PowerBI Language(s)

## DAX

```
1 WGrowth =  
2 VAR _MAX =  
3     CALCULATE (  
4         MAX ( BlitzFirst_WaitStats_Deltas[Wait Time, Minutes per Minute] );  
5         VALUES ( BlitzFirst_WaitStats_Deltas[wait_type] )  
6     )  
7 VAR _AVG =  
8     CALCULATE (  
9         AVERAGE ( BlitzFirst_WaitStats_Deltas[Wait Time, Minutes per Minute] );  
10        ALL ( BlitzFirst_WaitStats_Deltas[wait_type] );  
11        ALL ( BlitzFirst_WaitStats_Deltas[CheckDate] )  
12    )  
13 RETURN  
14 IF (  
15     RANKX (  
16         ALL ( BlitzFirst_WaitStats_Deltas[wait_type] );  
17         DIVIDE ( _MAX; _AVG );  
18         ;  
19         DESC;  
20         DENSE  
21     ) <= 5;  
22     DIVIDE ( _MAX; _AVG );  
23     BLANK ()  
24 )  
25
```

- The actual data analysis language for PowerBI, also used for business analysis in SSAS Tabular & Excel PowerPivot

# Storage Modes

Import:

Imported tables are cached. Queries submitted to the Power BI dataset are fulfilled only from the cache.

DataSet refreshes can be scheduled, but there is a hard limit of 8 scheduled refreshes per day (no limit on manual refreshes)

DirectQuery:

Tables aren't cached. Queries that you submit to the Power BI and that return data from DirectQuery tables can be fulfilled only by executing on-demand queries to the data source. Queries that you submit to the data source use the query language for that data source - for example, SQL.

# PowerBI *limitations* as a monitoring tool

## Relationships

- Relationships work best when one-to-many or one-to-one and unidirectional
- Bidirectional relationships can introduce cycles and can be blocked in the model
- There **can be only one active relationship** between one table and another (multiple keys)

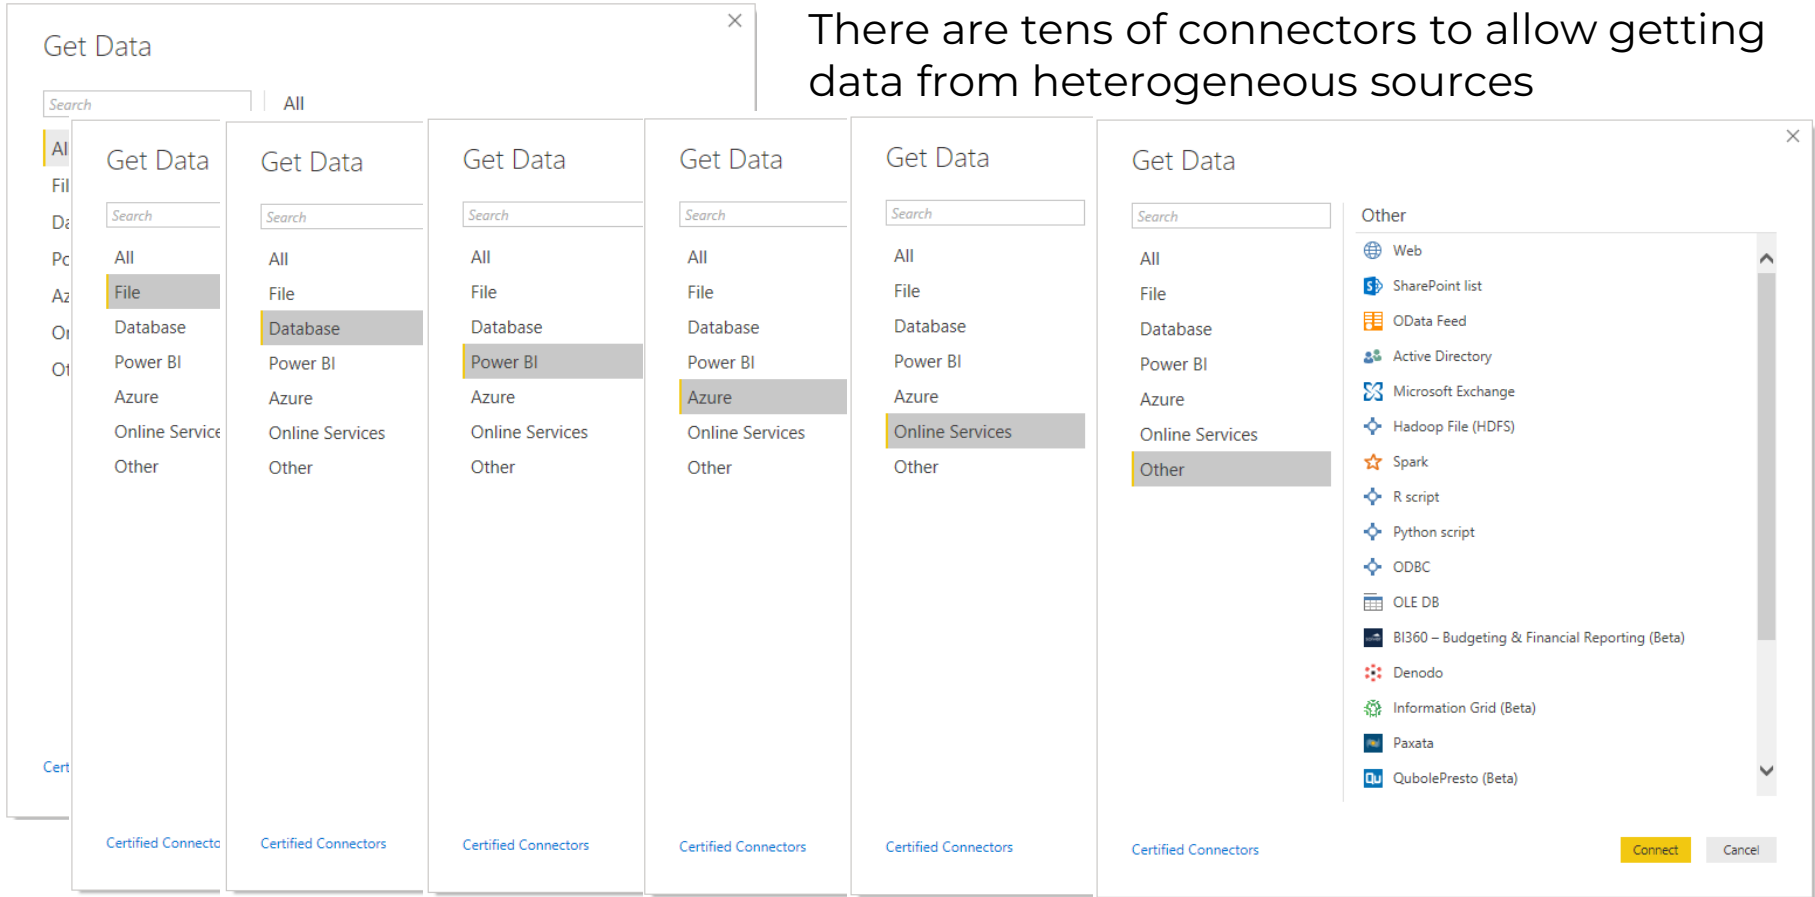

## Engine

- The dataset is a SSAS Tabular model, based on columnar database engine, good for aggregations, not so good for row by row operations.
- DAX syntax/logic is non straightforward coming from SQL and has a somewhat steep learning curve

The background is a white canvas decorated with various colorful geometric shapes, primarily triangles and polygons, in shades of purple, blue, orange, red, green, and yellow. These shapes are arranged in a way that they appear to be floating or scattered around the central text.

# Getting Data

There are tens of connectors to allow getting data from heterogeneous sources

You can find the [list of PowerBI Connectors here](#)

**Finally, hands on!  
Let's create a report from  
scratch**

The background is a white canvas decorated with various colorful geometric shapes, primarily triangles and polygons. These shapes are arranged in a non-uniform, abstract pattern. The colors include shades of purple, blue, orange, yellow, green, and red. Some shapes are large and prominent, while others are small and scattered. The overall effect is a vibrant, modern, and geometric aesthetic.

# Premade Examples

# Disclaimer

In this section a few examples of PowerBI reports for SQL Server will be shown

The point is to explain the concept via examples, which could then be applied to any platform

Since we're at a SQL Server event, I'll be focusing and providing material for this platform

# FirstResponders Kit PowerBI Report

The FirstResponders Kit is an open source collection of procedures that allows SQL Server DBAs to monitor and manage their instances faster, leveraging all the relevant SQL Server DMVs

Health Check:  
sp\_Blitz

Is my SQL Server healthy, or sick?

Speed Check:  
sp\_BlitzFirst

Why is my SQL Server slow right now?

Query Check:  
sp\_BlitzCache

Which queries have been using the most resources?

Index Check:  
sp\_BlitzIndex

Are my indexes designed for speed?

Vital Stats: Power BI

Graph server and query performance over time.

Cloud Restores:  
sp\_AllNightLog

How can I use the cloud for disaster recovery?

Query Trending:  
sp\_BlitzQueryStore

How has my query plan changed over time?

Who's Doing What:  
sp\_BlitzWho

Who's running what queries right now?

The PowerBI report is technically deprecated (issues with GitHub collaboration for a binary) However:

- It will work as-is until the schema of the table/views in the kit is changed (probably never)
- I'll continue to support and evolve it over my repository (as I was it's major contributor, I grew attached to it)

# Xevents Dashboard (track query errors)

# Streaming Dataset

## API info on Demo Stream

Use the API endpoint URL and one of the examples shown below to send data to your streaming dataset. For more information, [read our API documentation and integration guide](#).

## New streaming dataset

Choose the source of your data

Push URL

`https://api.powerbi.com/beta/bf6a4def-a7e9-4a4e-a417-9e19ff2599b5/data:`

Raw

cURL

PowerShell

```
[
  {
    "MachineName" : "AAAAA55555",
    "TimeStamp" : "2019-09-21T22:40:01.475Z",
    "FreeMemoryBytes" : 98.6,
    "TotalProcessorTime" : 98.6
  }
]
```

Data can be **live** streamed to a Dashboard

# Thanks!
